

# Grant Street Transportation Center

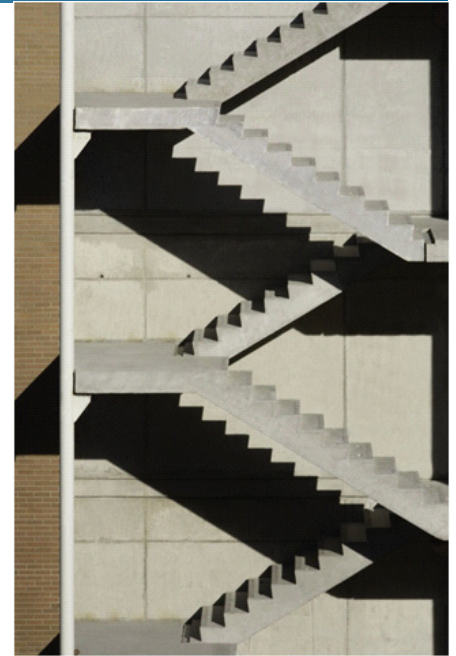

*Pittsburgh, Pennsylvania*

*“From an aesthetic standpoint we knew that precast stairs would look much cleaner and consistent than poured in place stairs. The stair towers on the Grant Street Transportation Center were designed to look as uniform as possible in color and form at every level (particularly from below) and at first glance appear to be floating in the glass enclosed stair towers”*

Tami Greene, IKM, Inc.

Precast stairs are an ideal choice for any parking structure, such as the Grant Street Transportation Center in Pittsburgh, Pennsylvania. Precast stairs arrive at the site as a finish product, erect quickly (1 hour per level in most cases) offering immediate and safe access for site workers and visitors.

Stair towers can also be incorporated as an element of visual interest and style within the design of the building structure, as seen with the Grant Street facility. This project features 51 sets of stairs in 4 egress towers, and 1 stand alone stair. Precast stairs are highly durable, low maintenance, and aesthetically appealing.
